

# Amazon Go-The first automated store

Amazon has opened its first **automated** store to the **public**. Amazon Go is a grocery store **located** on the ground level of the **corporation's** Seattle **headquarters**.

The store, which offers **food**, salads and **boxed meals** could **revolutionize** our **shopping experience** in the future.

As soon as you arrive at the store, a cell phone app **connected** to an Amazon account **registers** your **presence**. Everything that happens in the store is **tracked** by hundreds of **infrared** cameras. When you pick up **items** from the shelves they are automatically put into your **virtual** shopping cart. The cameras also **detect** when you put an item back on the shelves and remove it from your cart. The moment you walk out your **account** is **charged** without making any **physical payment**.

The technologies used at Amazon Go are the same as with **driverless** cars - computer tracking, **weight sensors** on shelves and **complicated algorithms**.

The 1,800 square foot store has been open to Amazon **employees** for a year. Now the **public** can also shop there.
